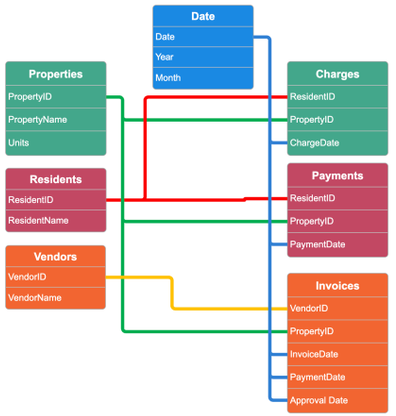
Data Architecture & Metrics

KPI Definitions

KPI Name	Definition
AR Balance	Total Charges - Total Payments
Avg Days to Approve	Average days between InvoiceDate and ApprovalDate
Avg Days to Pay	Average days between InvoiceDate and PaymentDate
Collection Rate	Total Payments divided by Total Charges
Expense Ratio	Total Expense / Total Revenue
NOI	[Total Revenue] - [Total Expenses]
NOI %	NOI divided by Total Revenue
Occupancy %	Active Residents / Total Units
Total Expenses	Sum of all vendor invoices
Total Revenue	Sum of all resident charges (rent, fees, etc.)

Entity Relationship Structure



The data model reflects a typical multifamily property management system, connecting residents, properties, vendors, and financial transactions.

Revenue and expense processes are structured through separate fact tables to support clear financial reporting. This design enables portfolio-level and property-level performance evaluation.

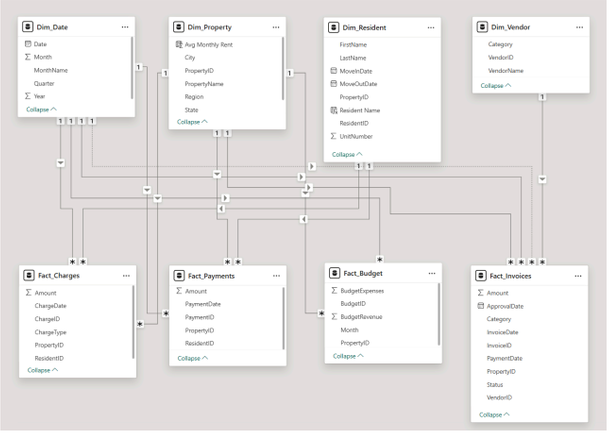
Model Purpose & Design Considerations

This report was designed to simulate a real-world multifamily financial reporting environment, integrating operational, accounting, and performance analytics into a unified model.

Occupancy is calculated using Move-In and Move-Out dates to reflect active tenancy over time. Revenue projections use blended average rental rates by property, while expenses are treated as operationally fixed for stabilization analysis.

All KPIs are defined through centralized DAX measures to maintain consistency and integrity across the report.

Semantic Model Overview



This report is built on a star schema model, separating dimension tables (Date, Property, Resident, Vendor) from transactional fact tables (Charges, Payments, Invoices, Budget).

The structure ensures clean filter flow, scalable performance, and consistent KPI calculations across the portfolio.
